PHASE 8 – PROJECT DEMONSTRATION

1. Project Demonstration Overview

The project demonstration presents the complete working of the Script-Controlled ACL – Restrict Record Access Based on Field Value project. The demonstration explains the project purpose, implementation, access control logic, and final working result.

2. Project Introduction

The project is developed in ServiceNow to control access to records based on user roles and branch values. The system uses ACLs and scripts to control Read, Write, Create, and Delete operations.

3. Project Purpose

The main purpose of the project is to provide secure and controlled access to records. Users can access records according to their assigned roles and branch values, while administrators have full access.

4. Technologies and Platform Used

- ServiceNow Platform
- Access Control Lists (ACLs)
- ACL Scripts
- Users and Roles
- Institution Details Table
- Branch-based access control

5. Demonstration Workflow

The project demonstration follows these steps:

- User and Role Creation
- Institution Details Table Creation
- Branch Values – ECE, EEE, CSE
- Create Branch-Based Records
- Configure Read ACL
- Configure Write ACL
- Configure Create ACL
- Configure Delete ACL
- Impersonate Different Users
- Verify Access Based on Branch
- Final Result

6. Working Demonstration

During the demonstration, the Institution Details table and branch-based records are shown. ACL configurations are demonstrated for Read, Write, Create, and Delete operations. Different users are tested to verify whether they can access the permitted records.

7. Access Verification

The EEE User is impersonated to verify the access control. The system displays the records according to the configured branch-based access rule. This confirms that the ACL configuration is controlling record access as intended.

8. Final Project Output

The final output demonstrates that record access is controlled based on the user's role and branch value. Unauthorized access is restricted, while authorized users can perform the permitted operations.

9. Demo Video

A video demonstration of the complete project is recorded. The video explains the project name, purpose, working process, access control configuration, testing, and final output.

10. Conclusion

The project demonstration confirms the working of the Script-Controlled ACL system in ServiceNow. The implemented ACLs and scripts provide controlled and secure access to branch-based records.
